How far has so far the Spin-Charge-Family theory succeeded to explain:

The Standard Model assumptions, the matter-antimatter asymmetry, the appearance of the Dark Matter, the second quantized fermion fields...., making several predictions

N.S. Mankoč Borštnik, University of Ljubljana 22st International Workshop "What comes beyond the standard models?"

Prague, 1-4 June 2020 by ZOOM

More than 50 years ago the electroweak (and colour) standard model offered an elegant new step in understanding the origin of fermions and bosons by postulating:

A.

- ► The existence of massless family members with the charges in the fundamental representation of the groups of the coloured triplet quarks and colourless leptons, of the left handed members as the weak charged doublets, of the right handed weak chargeless members, of the left handed quarks distinguishing in the hyper charge from the left handed leptons, of each right handed member having a different hyper charge.
- ► The existence of massless families to each of a family member.

	lpha name	hand- edness -4iS ⁰³ S ¹²	weak charge $ au^{13}$	hyper charge Y	colour charge	elm charge <i>Q</i>
	\mathbf{u}_{L}^{i}	-1	$\frac{1}{2}$	$\frac{1}{6}$	colour triplet	<u>2</u> 3
	\mathbf{d}_{L}^{i}	-1	$-\frac{1}{2}$	$\frac{1}{6}$	colour triplet	$-\frac{1}{3}$
Ì	$ u_{L}^{i}$	-1	$\frac{1}{2}$	$-\frac{1}{2}$	colourless	0
	eĽ	-1	$-\frac{1}{2}$	$-\frac{1}{2}$	colourless	-1
ĺ	u <mark>i</mark>	1	weakless	2/3	colour triplet	2 3
	\mathbf{d}_{R}^{i}	1	weakless	$-\frac{1}{3}$	colour triplet	$-\frac{1}{3}$
Ì	$ u_{R}^{i}$	1	weakless	0	colourless	0
	e_{R}^{i}	1	weakless	-1	colourless	-1

Members of each of the i=1,2,3 families, i=1,2,3 massless before the electroweak break. Each family contains the left handed weak charged quarks and the right handed weak chargeless quarks, belonging to the colour triplet $(1/2,1/(2\sqrt{3}))$, $(-1/2,1/(2\sqrt{3}))$, $(0,-1/(\sqrt{3}))$.

And the anti-fermions to each family and family member.

B.

► The existence of massless vector gauge fields to the observed charges of the family members, carrying charges in the adjoint representation of the charge groups.

Gauge fields before the electroweak break

► Three massless vector fields, the gauge fields of the three charges.

name	hand-	weak	hyper	colour	elm
	edness	charge	charge	charge	charge
hyper photon	0	0	0	colourless	0
weak bosons	0	triplet	0	colourless	triplet
gluons	0	0	0	colour octet	0

They all are vectors in d = (3 + 1), in the adjoint representations with respect to the weak, colour and hyper charges.

C.

- ▶ The existence of a massive scalar field the higgs, or carrying the weak charge $\pm \frac{1}{2}$ and the hyper charge $\mp \frac{1}{2}$ as it would be in the fundamental representation of the groups,
 - o gaining at some step a "nonzero vacuum expectation values", breaking the weak and the hyper charge and correspondingly breaking the mass protection.
- The existence of the Yukawa couplings, taking care of o the properties of fermions and o the masses of the heavy bosons.

► The Higgs's field, the scalar in d = (3 + 1), a doublet with respect to the weak charge.

name	hand- edness	weak charge	hyper charge	colour charge	elm charge
0∙ Higgs _u	0	$\frac{1}{2}$	$\frac{1}{2}$	colourless	1
< Higgs _d >	0	$-\frac{1}{2}$	$\frac{1}{2}$	colourless	0

	name	hand-	weak	hyper	colour	elm
		edness	charge	charge	charge	charge
•	< Higgs _u >	0	$\frac{1}{2}$	$-\frac{1}{2}$	colourless	0
	0⋅ Higgs _d	0	$-\frac{1}{2}$	$-\frac{1}{2}$	colourless	-1

D.

► There is the gravitational field in d=(3+1).

- ► The standard model assumptions have been confirmed without offering surprises.
- ► The last unobserved field as a field, the Higgs's scalar, detected in June 2012, was confirmed in March 2013.
- ► The waves of the gravitational field were detected in February 2016 and again 2017.

- ► The standard model assumptions have in the literature several explanations, but with many new not explained assumptions.
- ► I am proposing the *spin-charge-family* theory, which offers the explanation for
 - i. all the assumptions of the standard model,
 - ii. for many observed phenomena:
 - ii.a. the dark matter,
 - ii.b. the matter-antimatter asymmetry,
 - ii.c. others observed phenomena,
 - iii. explaining the Dirac's postulates for the second quantized fermions,
 - iv. making several predictions.

Is this the right next step beyond both standard models?

**

There are namely many other phenomena not yet understood, like:

- ► the dark energy,
- the observed dimension of space time,
- the quantization of the gravitational field,
- . . .

► Work done so far on the spin-charge-family theory is promising.

** We try to understand:

- What are elementary constituents and interactions among constituents in our Universe, in any universe?
- Can the elementary constituent be of only one kind? Are the four observed interactions — gravitational, elektromagnetic, weak and colour — of the common origin?
- ▶ Is the space-time the so far observed (3 + 1)? Why (3+1)?
- ▶ If not (3 + 1) may it be that the space-time is infinite?
- How has the space-time of our universe started?
- What is the matter and what the anti-matter?

Obviously it is the time to make the next step beyond both standard models.

What questions should one ask to be able to find next steps beyond the *standard models* and to understand not yet understood phenomena?

- ▶ o Where do family members originate?
 - o Where do charges of family members originate?
 - o Why are the charges of family members so different?
 - o Why have the left handed family members so different charges from the right handed ones?
- o Where do families of family members originate?
 - o How many different families exist?
 - o Why do family members quarks and leptons manifest so different properties if they all start as massless?

- o How is the origin of the scalar field (the Higgs's scalar) and the Yukawa couplings connected with the origin of families?
 o How many scalar fields determine properties of the so far (and others possibly be) observed fermions and masses of weak bosons? (The Yukawa couplings certainly speak for the existence of several scalar fields with the properties of Higgs's scalar.)
- Why is the Higgs's scalar, or are all scalar fields, if there are several, doublets with respect to the weak and the hyper charge?
- ► Do exist also scalar fields with the colour charge in the fundamental representation and where, if they are, do they manifest?

- Where do the charges and correspondingly the so far (and others possibly be) observed vector gauge fields originate?
- Where does the dark matter originate?
- ► Where does the "ordinary" matter-antimatter asymmetry originate?
- Where does the dark energy originate?
- ▶ What is the dimension of space? (3+1)?, ((d-1)+1)?, ∞ ?
- ► What is the role of the symmetries— discrete, continuous, global and gauge in our universe, in Nature?
- And many others.

My statement:

- ► An elegant trustworthy next step must offer answers to several open questions, explaining:
 - o The origin of the family members and the charges.
 - o The origin of the families and their properties.
 - o The origin of the scalar fields and their properties.
 - o The origin of the vector fields and their properties.
 - o The origin of the dark matter.
 - The origin of the "ordinary" matter-antimatter asymmetry.

My statement continues:

- ► There exist not yet observed families, gauge vector and scalar gauge fields.
- ▶ Dimension of space is larger than 4 (very probably infinite).
- ► Inventing a next step which covers one of the open questions, might be of a help but can hardly show the right next step in understanding nature.

In the literature NO explanation for the existence of the families can be found, which would not just assume the family groups.

Several extensions of the standard model are, however, proposed, like:

► The SU(3) group is assumed to describe – not explain – the existence of three families. Like the Higgs's scalar charges are in the fundamental representations of the groups, also the Yukawas are assumed to emerge from the scalar fields, in the fundamental representation of the SU(3) group.

- ➤ SU(5) and SO(10) grand unified theories are proposed, unifying all the charges. But the spin (the handedness) is obviously connected with the (weak and the hyper) charges, what these theories do "by hand" as it does the *standard model*, and the appearance of families is not explained.
- ▶ Supersymmetric theories, assuming the existence of bosons with the charges of quarks and leptons and fermions with the charges of the gauge vector fields, although having several nice properties but not explaining the appearance of families (except again by assuming larger groups), are not, to my understanding, the right next step beyond the standard model.

- o The Spin-Charge-Family theory does offer the explanation for all the assumptions of the standard model, answering up to now several of the above cited open questions!
 - o The more effort is put into this theory, the more answers to the open questions in elementary particle physics and cosmology is the theory offering.

- o I shall first make a short introduction into the Spin-Charge-Family theory.
- o I shall make an overview of achievements so far of the Spin-Charge-Family theory.
- o I shall report on how does the odd Clifford algebra explain the second quantization postulates of Dirac.

[arXiv:1802.05554v1v2, arXiv:1802.05554v4, arXiv:1902.10628].

► A brief introduction into the **spin-charge-family theory**.

- Spinors carry in d ≥ (13 + 1) two kinds of spin, no charges, Phys. Rev. D 91 065004 (2015), J.of Mod. Physics 6 (2015) 2244.
 - o The Dirac spin (γ^a) in d=(13+1) describes in d=(3+1) spin and ALL the charges of quarks and leptons, left and right handed, explaining all the assumptions about the charges and the handedness of the standard model J. of Math. Phys. **34** (1993), 3731, J. of Math. Phys. **43**, 5782 (2002) [hep-th/0111257].
 - o The second kind of spin ($\tilde{\gamma}^a$) describes FAMILIES, explaining the origin of families and their number, *J. of Math. Phys.* **44** 4817 (2003) [hep-th/0303224].
 - o There is NO third kind of spin.
- ▶ C,P,T symmetries in d = (3+1) follow from the C,P,T symmetry in $d \ge (13+1)$. (JHEP 04 (2014) 165)

- ► All vector and scalar gauge fields origin in gravity, explaining the origin of the vector and scalar gauge fields, which in the standard model are assumed Eur. Phys. J. C 77 (2017) 231:
 - o They origin in two spin connection fields, the gauge fields of $\gamma^a \gamma^b$ and $\tilde{\gamma}^a \tilde{\gamma}^b$, and in
 - o vielbeins, the gauge fields of momenta Eur. Phys. J. C 77 (2017) 231, [arXiv:1604.00675]
- ▶ If there are no spinor sources present, then either vector $(\vec{A}_m^A, m = 0, 1, 2, 3)$ or scalar $(\vec{A}_s^A, s = 5, 6, ..., d)$ gauge fields are determined by vielbeins uniquely.

- Spinors interact correspondingly with
 the vielbeins and
 the two kinds of the spin connection fields, Eur. Phys.
 J. C 77 (2017) 231.
- ▶ In d = (3+1) the spin-connection fields, together with the vielbeins, manifest either as o vector gauge fields with all the charges in the adjoint representations or as o scalar gauge fields with the charges with respect to the space index in the "fundamental" representations and all the other charges in the adjoint representations or as o tensor gravitational field.

There are two kinds of scalar fields with respect to the space index s:

▶ Those with (s = 5, 6, 7, 8) (they carry zero "spinor charge") are doublets with respect to the $SU(2)_I$ (the weak) charge and the second $SU(2)_{II}$ charge (determining the hyper charge). They are in the adjoint representations with respect to the family and the family members charges.

o These scalars explain the Higgs's scalar and the Yukawa couplings.

Phys. Rev. **D 91** (2015) 6, 065004

- ► Those with twice the "spinor charge" of a quark and (s = 9, 10, ..d) are colour triplets. Also they are in the adjoint representations with respect to the family and the family members charges.
 - o These scalars transform antileptons into quarks, and antiquarks into quarks and back and correspondingly contribute to matter-antimatter asymmetry of our universe and to proton decay.
- ▶ There are no additional scalar fields in the spin-charge-family theory, if d = (13 + 1).

Phys. Rev. **D 91** (**2015**) 6, 065004 J. of Mod. Phys. **6** (**2015**) 2244

Condensate

- ► The (assumed so far, waiting to be derived how does this spontaneously appear) scalar condensate of two right handed neutrinos with the family quantum numbers of the upper four families (there are two four family groups in the theory), appearing $\approx 10^{16}$ GeV or higher.
 - o breaks the CP symmetry, causing the matter-antimatter asymmetry and the proton decay,
 - o couples to all the scalar fields, making them massive,
 - o couples to all the phenomenologically unobserved vector gauge fields, making them massive.
 - o Before the electroweak break all the so far observed vector gauge fields are massless.

Phys. Rev. **D 91** (**2015**) 6, 065004, J. of Mod. Phys. 6 (2015) 2244,

J. Phys.: Conf.Ser. 845 01, **IARD 2017**

- ► The vector fields, which do not couple to the condensate and remain massless, are:
 - o the hyper charge vector field.
 - o the weak vector fields,
 - o the colour vector fields,
 - o the gravity fields.

The $SU(2)_{II}$ symmetry breaks due to the **condensate**, leaving the **hyper charge unbroken**.

Nonzero vacuum expectation values of scalars

- waiting to be shown how does such an event appear in the spin-charge-family spontaneously.
- ► The scalar fields with the space index (7,8), gaining nonzero vacuum expectation values, cause the electroweak break,
 - o breaking the weak and the hyper charge,
 - o changing their own masses,
 - o bringing masses to the weak bosons,
 - o bringing masses to the families of quarks and leptons.

```
Phys. Rev. D 91 (2015) 6, 065004,

J. Phys.: Conf.Ser. 845 01 IARD 2017,

Eur. Phys. J.C. 77 (2017) 231 [arXiv:1604.00675],

J. of Mod. Phys. 6 (2015) 2244, [arXiv:1502.06786,

arXiv:1409.4981]
```

- ► The only gauge fields which do not couple to these scalars and remain massless are
 - o electromagnetic,
 - o colour vector gauge fields,
 - o gravity.
- ► There are two times four decoupled massive families of quarks and leptons after the electroweak break:
 - o There are the observed three families among the lower four, the fourth to be observed.
 - o The stable among the upper four families form the dark matter.

- ▶ It is extremely encouraging for the spin-charge-family theory, that a simple starting action contains all the degrees of freedom observed at low energies, directly or indirectly, and that only the
 - o condensate and
 - o nonzero vacuum expectation values of all the scalar fields with s = (7,8)

are needed that the theory explains

- o all the assumptions of the standard model, with the gauge fields, scalar fields, families of fermions, masses of fermions and of bosons included,
- o explaining also the dark matter,
- o the matter/antimatter asymmetry,
- o the triangle anomalies cancellation in the standard model (Forts. der Physik, Prog.of Phys.) (2017) 1700046) and...

The spin-charge-family theory is a kind of a Kaluza-Klein-like theory, but with two kinds of spins.

In *d*-dimensional space there are fermions with two kinds of spins and gravity, represented by two spin connection and vielbein gauge fields.

J. of Mod. Phys. **4** (2013) 823, Phys. Rev. **D 91** (2015) 6, 065004, J. of Mod. Phys. **6** (2015) 2244 [arxiv:1409.4981], IARD, J. Phys.: Conf. Ser. 845 (2017) 012017 [arXiv:1607.01618]/v2], Eur. Phys. J.C. **77** (2017) 231, Forts. der Physik, Prog. of Phys.) (2017) 1700046

Comparing the spin-charge-family and the unifying theories, with the Kaluza-Klein like theories included.

- ▶ The SO(10) must be put into SO(13,1),
- allowing only gravity as gauge fields,
- recognizing that there are two kinds of the Clifford algebra objects
 - o one explaining spins and charges of fermions,
 - o the second one explaining families of fermions.

This would be the first step towards the spin-charge-family theory, if assuming as well the simple starting action for fermions and gauge fields.

At low energies the simple starting action for fermions and gravity manifest all the observed degrees of freedom — quarks and leptons antiquarks and antileptons, the observed gauge vector and scalar fields — so that nothing in addition is needed.

- One has to recognize:
- that the scalar gauge fields are of two kinds due to the two kinds of the Clifford algebra objects,
- offering the explanation for several so far observed phenomena,
 - o for the masses of fermions and weak bosons,
 - o for the appearance of the matter-antimatter asymmetry in the universe,
 - o for the appearance of the dark matter,
 - o and for several other phenomena.
- One must also demonstrate that breaking symmetry can steel lead to (almost) massless fermions,
- proving this, making several predictions.

- No assumptions for the group contents of fermions to represent spins, charges and families are needed, what other theories must make.
- ► In addition, as I shall discuss in this talk, the theory offers the second quantized fields, explaining the Dirac postulates.

A short look "inside" the spin-charge-family theory.

There are only two kinds of the Clifford algebra objects in any d:

- ► The **Dirac** γ^a **operators** (used by Dirac 90 years ago).
- ▶ The **second one:** $\tilde{\gamma}^a$, which I recognized in the Grassmann space.
- ► The two kinds form two independent spaces.

$$\begin{aligned} \{\boldsymbol{\gamma}^{\mathbf{a}},\boldsymbol{\gamma}^{\mathbf{b}}\}_{+} &=& \mathbf{2}\boldsymbol{\eta}^{\mathbf{a}\mathbf{b}} = \{\tilde{\boldsymbol{\gamma}}^{\mathbf{a}},\tilde{\boldsymbol{\gamma}}^{\mathbf{b}}\}_{+}, \\ \{\boldsymbol{\gamma}^{\mathbf{a}},\tilde{\boldsymbol{\gamma}}^{\mathbf{b}}\}_{+} &=& 0, \end{aligned}$$

The postulate

$$\begin{split} (\tilde{\gamma}^{\mathbf{a}}\mathbf{B}: &= \mathbf{i}(-)^{\mathbf{n}_{\mathbf{B}}}\mathbf{B}\gamma^{\mathbf{a}}) |\psi_{0}>, \\ (\mathbf{B} &= a_{0} + a_{a}\gamma^{a} + a_{ab}\gamma^{a}\gamma^{b} + \dots + a_{a_{1}\cdots a_{d}}\gamma^{a_{1}}\dots\gamma^{a_{d}})|\psi_{o}>, \end{split}$$

where $(-)^{n_B}=+1,-1$, when the object B has a Clifford even or odd character, respectively, and $|\psi_o>$ is a vacuum state on which the operators γ^a apply,

reduces the Clifford space for the factor of two, while the operators $\tilde{\gamma}^a \tilde{\gamma}^b$ define the family quantum numbers.

$$\begin{split} \textbf{S}^{ab} &:= (\textbf{i}/\textbf{4})(\gamma^a\gamma^b - \gamma^b\gamma^a), \\ \tilde{\textbf{S}}^{ab} &:= (\textbf{i}/\textbf{4})(\tilde{\gamma}^a\tilde{\gamma}^b - \tilde{\gamma}^b\tilde{\gamma}^a), \\ \{\textbf{S}^{ab}, \tilde{\textbf{S}}^{cd}\}_- &= \textbf{0}. \end{split}$$

▶ S̃^{ab} define the equivalent representations with respect to S^{ab}.

My recognition:

▶ If γ^a are used to describe the spin and the charges of spinors,

 $\tilde{\gamma}^a$ - since it must be used or it must be explained why it does not manifest - it must be used to describe families of spinors.

```
Phys. Lett. B 292, 25-29 (1992),
J. Math. Phys. 34, 3731-3745 (1993),
Mod. Phys. Lett. A 10, 587-595 (1995)
```

A simple action for a spinor which carries in d = (13 + 1) only two kinds of spins (no charges) and for the gauge gravitational fields, with which spinors interact:

$$S = \int d^{d}x E \mathcal{L}_{f} + \int d^{d}x E \left(\alpha R + \tilde{\alpha} \tilde{R}\right)$$

$$\mathcal{L}_{f} = \frac{1}{2} (\bar{\psi} \gamma^{a} p_{0a} \psi) + h.c.$$

$$p_{0a} = f^{\alpha}{}_{a} p_{0\alpha} + \frac{1}{2E} \{ p_{\alpha}, Ef^{\alpha}{}_{a} \}_{-}$$

$$\mathbf{p}_{0\alpha} = \mathbf{p}_{\alpha} - \frac{1}{2} \mathbf{S}^{ab} \omega_{ab\alpha} - \frac{1}{2} \tilde{\mathbf{S}}^{ab} \tilde{\omega}_{ab\alpha}$$

► The Einstein action for a free gravitational field is assumed to be linear in the curvature

- ► The only internal degrees of freedom of spinors (fermions) are the two kinds of the spin.
- ► The only gauge fields are the gravitational ones vielbeins and the two kinds of spin connections.
- ▶ Both, γ^a and $\tilde{\gamma}^a$, transform as vectors in d, and correspondingly also $f^{\alpha}{}_{a}\omega_{bc\alpha}$ and $f^{\alpha}{}_{a}\tilde{\omega}_{bc\alpha}$ transform as tensors with respect to the flat index a.

Variation of the action brings for $\omega_{ab\alpha}$

$$\begin{split} \omega_{ab\alpha} &= -\frac{1}{2E} \bigg\{ e_{e\alpha} e_{b\gamma} \, \partial_{\beta} \big(E f^{\gamma[e} f^{\beta}{}_{a]} \big) + e_{e\alpha} e_{a\gamma} \, \partial_{\beta} \big(E f^{\gamma}{}_{[b} f^{\beta e]} \big) \\ &- e_{e\alpha} e^{e}{}_{\gamma} \, \partial_{\beta} \big(E f^{\gamma}{}_{[a} f^{\beta}{}_{b]} \big) \bigg\} \\ &- \frac{e_{e\alpha}}{4} \bigg\{ \bar{\Psi} \left(\gamma_{e} S_{ab} + \frac{3i}{2} \left(\delta^{e}_{b} \gamma_{a} - \delta^{e}_{a} \gamma_{b} \right) \right) \Psi \bigg\} \\ &- \frac{1}{d-2} \bigg\{ e_{a\alpha} \left[\frac{1}{E} e^{d}{}_{\gamma} \partial_{\beta} \left(E f^{\gamma}{}_{[d} f^{\beta}{}_{b]} \right) + \frac{1}{2} \bar{\Psi} \gamma^{d} S_{db} \Psi \right] \\ &- e_{b\alpha} \left[\frac{1}{E} e^{d}{}_{\gamma} \partial_{\beta} \left(E f^{\gamma}{}_{[d} f^{\beta}{}_{a]} \right) + \frac{1}{2} \bar{\Psi} \gamma^{d} S_{da} \Psi \right\} \bigg] \end{split}$$

IARD, J. Phys.: Conf. Ser. 845 012017 and the refs. therein

and for $\tilde{\omega}_{ab\alpha}$,

$$\begin{split} \tilde{\omega}_{ab\alpha} &= -\frac{1}{2E} \bigg\{ e_{e\alpha} e_{b\gamma} \, \partial_{\beta} \big(E f^{\gamma[e} f^{\beta}_{a]} \big) + e_{e\alpha} e_{a\gamma} \, \partial_{\beta} \big(E f^{\gamma}_{[b} f^{\beta e]} \big) \\ &- e_{e\alpha} e^{e}_{\gamma} \, \partial_{\beta} \big(E f^{\gamma}_{[a} f^{\beta}_{b]} \big) \bigg\} \\ &- \frac{e_{e\alpha}}{4} \bigg\{ \bar{\Psi} \left(\gamma_{e} \tilde{S}_{ab} + \frac{3i}{2} \left(\delta_{b}^{e} \gamma_{a} - \delta_{a}^{e} \gamma_{b} \right) \right) \Psi \bigg\} \\ &- \frac{1}{d-2} \bigg\{ e_{a\alpha} \left[\frac{1}{E} e^{d}_{\gamma} \partial_{\beta} \left(E f^{\gamma}_{[d} f^{\beta}_{b]} \right) + \frac{1}{2} \bar{\Psi} \gamma^{d} \tilde{S}_{db} \Psi \right] \\ &- e_{b\alpha} \left[\frac{1}{E} e^{d}_{\gamma} \partial_{\beta} \left(E f^{\gamma}_{[d} f^{\beta}_{a]} \right) + \frac{1}{2} \bar{\Psi} \gamma^{d} \tilde{S}_{da} \Psi \right\} \bigg] \end{split}$$

Eur. Phys. J. C, **77** (2017) 231 and the refs. therein. If there are no spinors present, the two spin connections are uniquely described by vielbeins $f^{\alpha}{}_{a}$.

Fermions

► The action for spinors seen from d = (3 + 1) and analyzed with respect to the standard model groups as subgroups of SO(13 + 1):

$$\mathcal{L}_{f} = \bar{\psi}\gamma^{m}(p_{m} - \sum_{A,i} g^{A}\tau^{Ai}A_{m}^{Ai})\psi + \begin{cases} \sum_{s=[7],[8]} \bar{\psi}\gamma^{s}p_{0s}\psi \} + \\ \{\sum_{s=[5],[6]} \bar{\psi}\gamma^{s}p_{0s}\psi + \\ \sum_{t=[9],...[14]} \bar{\psi}\gamma^{t}p_{0t}\psi \}. \end{cases}$$

Covariant momenta

► The colour, elm, weak and hyper vector gauge fields do not interact with the condensate and remain massless.

J. of Mod. Physics 6 (2015) 2244

At the electroweak break from

$$SO(1,3) \times SU(2)_I \times U(1)_I \times SU(3)$$
 to $SO(1,3) \times U(1) \times SU(3)$

- o scalar fields with the space index s = (7,8) obtain nonzero vacuum expectation values,
- o break correspondingly the weak and the hyper charge and change their own masses.
- o They leave massless only the colour, elm and gravity gauge fields.
- ▶ All the eight massless families gain masses.

Also these is so far just assumed, waiting to be proven that scalar fields, together with boundary conditions, are spontaneously causing also this last breaks.

But all the needed degrees of freedom are already in the simple starting action, looking so far very promising.

- ▶ To the electroweak break several scalar fields, the gauge fields of twice $\widetilde{SU}(2) \times \widetilde{SU}(2)$ and three $\times U(1)$, contribute, all with the weak and the hyper charge of the standard model Higgs.
- ▶ They carry besides the weak and the hyper charge either o the family members quantum numbers originating in (Q,Q',Y') or o the family quantum numbers originating in twice $\widetilde{SU}(2) \times \widetilde{SU}(2)$.
 - J. of Mod. Physics 6 (2015) 2244.

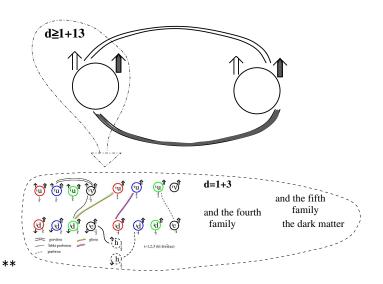

▶ The mass matrices of each family member manifest the $\widetilde{SU}(2) \times \widetilde{SU}(2) \times U(1)$ symmetry, which remains unchanged in all loop corrections,

while repetitions of the nonzero vacuum expectation values of the scalar fields, together with loop corrections, both in all orders, give a controllable change of this symmetry.

[arXiv:1902.02691, arXiv:1902.10628]

▶ We studied on a toy model of d = (1 + 5) conditions which lead after breaking symmetries to massless spinors chirally coupled to the Kaluza-Klein-like gauge field.,

New J. Phys. **13** (**2011**) 103027, 1-25, Int. J Mod. Phys. **A 29**, 1450124 (**2014**), 21 pages.

Families of quarks and leptons and antiquarks and antileptons

Our technique to represent spinors is elegant.

New way of second quantization of fermion fields in the odd Clifford algebra manifesting families and family members of quarks and leptons and antiquarks and antileptons Explaining the Dirac postulates for second quantized fermions.

Any family irreducible Lorentz representation of the odd Clifford algebra of SO(13,1) includes 64 members—all the quarks and the leptons, the antiquarks and the antileptons, left and right handed, with spin up and spin down—with the following properties:

- ► Quarks distinguish from leptons only in the SU(3)× U(1) subgroup of the group SO(13,1)
- ► The SO(7,1) subgroup with 8 elements is the same for quarks and leptons, and the same for antiquarks and antileptons.
- ► The Hermitian conjugated representation belong to another odd irreducible representation of the group SO(13,1).

▶ Defining the creation operator in the internal space:

$$u_{\uparrow R}^{c1\dagger} \Leftrightarrow b_1^{1\dagger} := (+i)(+) | (+)(+)(+) | (+)(-)(-),$$

▶ its Hermitian conjugated partner is

$$u_{\uparrow R}^{c1} \Leftrightarrow (\mathbf{b_1^{1\dagger}})^{\dagger} = \overset{13}{(+)} \overset{1411}{(+)} \overset{129}{(-)} \overset{10}{(-)} \overset{78}{(-)} \overset{56}{(-)} \overset{12}{(-)} \overset{03}{(-)},$$

- ▶ $u_{\downarrow R}^{c1\dagger} \Leftrightarrow b_2^{1\dagger} := [-i][-] \mid (+)(+)(+) \mid | (+)(-)(-), \text{ and}$
- $\hat{b}_{2}^{1} := (+) (+) (-) || (-) (-) || [-] [-i],$
-
- **.....**

Creation and Hermitian conjugated partners, operating on a vacuum state

- ▶ $|\psi_o>= [-\mathbf{i}][-][-] \cdots [-] |\mathbf{0}>$
- define fermion states—quarks and leptons and antiquarks and antileptons—of one of 8 families.

One finds the following anti-commutation relations for a fermion fields, which represent "basic vectors" in internal space determining properties of the observed quarks and leptons ($i=(u_{R,L}^{f,\uparrow,\downarrow},d_{R,L}^{f,\uparrow,\downarrow},v_{R,L}^{f,\uparrow,\downarrow},e_{R,L}^{f,\uparrow,\downarrow})$) and anti-quarks and anti-leptons , with the family quantum number f.

[arXiv:1802.05554v1], [arXiv:1802.05554v4], [arXiv:1902.10628]

- ► There are 2^{d/2-1} different "basic vectors" for each of 2^{d/2-1} families in d-dimensional space, if there is no break of symmetries.
- ► They are defined for any momentum (p^0, \vec{p}) in any dimension d.
- ▶ The "basic vectors" manifest in d = (3+1) space spins, charges and families, but not yet include the momentum space.

The superposition of "basic vectors" of particular family can be chosen so that it solves the equations of motion for, let us choose, free massless fermions.

$$\begin{split} \mathcal{A} &= \int \, \, \mathbf{d^d x} \, \, \frac{1}{2} \, (\psi^\dagger \gamma^{\mathbf{0}} \, \gamma^{\mathbf{a}} \mathbf{p_a} \psi) + \mathrm{h.c.} \, , \\ \gamma^{\mathbf{a}} \mathbf{p_a} |\psi> &= \mathbf{0} \, , \end{split}$$

The plane wave solution s for $p^a=(p^0,p^1,p^2,p^3,0,0,\cdots,0)$, for a particular family and right handedness, for example, is the superposition $\hat{b}^{s,ch,f\dagger}(\vec{p})$

$$\hat{b}^{s,ch,f\dagger}(\vec{p}) = \alpha(\tilde{\mathbf{p}}) \mathbf{b}^{\mathsf{ch},f\dagger}_{\uparrow} + \beta(\tilde{\mathbf{p}}) \mathbf{b}^{\mathsf{ch},f\dagger}_{\downarrow} \ \mathbf{e}^{-\mathbf{i}(\mathbf{p}_0 \mathbf{x}^0 - \tilde{\mathbf{p}} \cdot \mathbf{x}^p)},$$

$$\mathbf{p}^0 = |\tilde{\mathbf{p}}|,$$

$$|\psi^{\mathrm{s,ch,f}}(\tilde{\mathbf{p}})> = \hat{\mathbf{b}}^{\mathrm{s,ch,f\dagger}}(\vec{p})|_{p^0=|\vec{p}|} |\psi_{oc}>,$$

▶ A general solution in d-dimensional space, where s notes spin, charges — originating in $d \ge 5$ — and handedness

$$\hat{b}^{s,f\dagger}(\tilde{p}) \ = \ \sum_i c^{sf}{}_{i\tilde{p}}\, b^{f\dagger}_i\, e^{-i(p_0x^0-\epsilon\tilde{p}\cdot x^p)}\,,$$

s represents different orthonormal solutions of the equations of motion, $\varepsilon=\pm 1$, depending on handedness and spin of solutions.

- ► There are $2^{\frac{d}{2}-1}$ different "basic vectors" for each of $2^{\frac{d}{2}-1}$ families.
 - Together $2^{\frac{d}{2}-1} \times 2^{\frac{d}{2}-1}$ "basic vectors", defining on the vacuum state the corresponding single particle states.
- We can for each momentum $\tilde{\mathbf{p}}$ have correspondingly a tensor products of one single particle state, of two single particle states, up to $2^{\frac{d}{2}-1} \times 2^{\frac{d}{2}-1}$ single particle states, if there is no break of symmetry.

- ► A tensor product of $2^{\frac{d}{2}-1} \times 2^{\frac{d}{2}-1}$ single particle states of all possible (∞ many) momenta \vec{p} , $|p^0| = |\vec{p}|$, form the Hilbert space of all possible Slater determinants with no state occupied, with one state — any one — occupied and all the rest unoccupied, with two states occupied, up to all the $2^{\frac{d}{2}-1} \times 2^{\frac{d}{2}-1}$ states occupied.
- ▶ The Hilbert space $\mathcal{H}_{\tilde{\mathbf{p}}}$ of a particular momentum $\tilde{\mathbf{p}}$ consists correspondingly of 2^{2^{d-2}} "Slater determinants". since the "Slater determinant" can have no occupied state, one occupied state, two occupied states, up to 2^{d-2} occupied states, respectively.
- ▶ The total Hilbert space \mathcal{H} is the infinite product $(\otimes_{\mathbb{N}})$ of $\mathcal{H}_{\tilde{\mathbf{n}}}$: $\mathcal{H} = \prod_{\tilde{\mathbf{p}}}^{\infty} \otimes_{\mathbf{N}} \mathcal{H}_{\tilde{\mathbf{p}}}$ where the product $(\otimes_{\mathbb{N}})$ is to point out that Clifford odd objects $\hat{\mathbf{b}}_{\mathbf{f}}^{s\dagger}$ and $\hat{\mathbf{b}}_{\mathbf{f}'}^{s\prime}$ "can not forget" that they are Clifford odd objects, no matter to which p their superposition $\hat{b}_{tot}^{sf}(\tilde{p}),\,p^0=|\tilde{p}|, \text{(solutions of equation of motion) belong.}$

 Correspondingly the Clifford odd creation and annihilation operators fulfill the anticommutation relations

$$\begin{split} \{\hat{\mathbf{b}}^{\mathbf{s},\mathbf{f}\dagger}(\tilde{\mathbf{p}}),\hat{\mathbf{b}}^{\mathbf{s}',\mathbf{f}'\dagger}(\tilde{\mathbf{p}}')\}_{+} &= \mathbf{0}\,,\\ \{\hat{\mathbf{b}}^{\mathbf{s},\mathbf{f}}(\tilde{\mathbf{p}}),\hat{\mathbf{b}}^{\mathbf{s}',\mathbf{f}'}(\tilde{\mathbf{p}}')\}_{+} &= \mathbf{0}\,,\\ \{\hat{\mathbf{b}}^{\mathbf{s},\mathbf{f}}(\tilde{\mathbf{p}}),\hat{\mathbf{b}}^{\mathbf{s}',\mathbf{f}'\dagger}(\tilde{\mathbf{p}}')\}_{+} &= \delta^{\mathbf{s}\mathbf{s}'}\delta^{\mathbf{f}\mathbf{f}'}\delta(\vec{p}-\vec{p'})\,, \end{split}$$

for any \vec{p} and any $\vec{p'}$.

• We can represent $\mathcal{H}_{\tilde{\mathbf{p}}}$ as follows

$$\begin{aligned} |0_{1p},0_{2p},0_{3p},\dots,0_{2^{d-2}p}>|_1 &, \\ |1_{1p},0_{2p},0_{3p},\dots,0_{2^{d-2}p}>|_2 &, \\ |0_{1p},1_{2p},0_{3p},\dots,0_{2^{d-2}p}>|_3 &, \\ |0_{1p},0_{2p},1_{3p},\dots,0_{2^{d-2}p}>|_4 &, \\ &\vdots & \\ |1_{1p},1_{2p},0_{3p},\dots,0_{2^{d-2}p}>|_{2^{d-2}+2} &, \end{aligned}$$

To define the whole Hilbert space ${\cal H}$ these Slater determinants must be repeated for ∞ number of $\tilde{p}.$

Let us compare the above second quantization procedure, describing internal space of fermions with the odd Clifford algebra objects, with the second quantization procedure proposed by Dirac, where he creation operators and correspondingly their Hermitian conjugate operators are assumed.

$$\begin{array}{c} \psi_{\mathbf{i}}(\mathbf{t},\tilde{\mathbf{x}}) = \sum_{\mathbf{p},\mathbf{i}} \, \hat{\mathbf{a}}^{\dagger}(\mathbf{p},\mathbf{i}) \, \mathbf{v}(\tilde{\mathbf{p}},\mathbf{i}) \, \mathbf{e}^{-\mathbf{p}_{\mathbf{a}}\mathbf{x}^{\mathbf{a}}}). \\ v(\vec{p},i) \text{ determine solutions of equations of motion for a particular} \\ \mathbf{e}^{-\mathbf{p}_{\mathbf{a}}\mathbf{x}^{\mathbf{a}}}. \end{array}$$

 $\hat{a}^{\dagger}(p,i)$ is just assumed, together with the (assumed) Hermitian conjugate operator, to fill the anticommutation relation.

In the spin-charge-family theory the creation operators appear by themselves from the odd Clifford objects, representing fermion states.

The anticommutation relations for creation operators and their Hermitian conjugated partners in the Dirac case in d = (3+1) for spin (\uparrow,\downarrow) and right and left handedness (± 1 , respectively)

in the case of massless fermions and discretized momenta for a fermion in a box.

► To be able to compare the spin-charge-family theory creation operators for this particular case of d = (3 + 1), we make a choice of the creation operators representing spin ↑ and right handedness,

$$\hat{b}_{1}^{\dagger} := [+i](+),$$
and spin \downarrow and right handedness,
$$\hat{b}_{2}^{\dagger} := (-i)[-],$$

and shall not pay attention on charges (which in spin-charge-family theory originate in $d \ge 5$) and families.

- In the spin-charge-family case the creation operators $\hat{b}_i^{\dagger}, i=(1,2)$ originate in "basic vectors" determining the internal degrees of freedom in the internal space of fermions.
- Solutions of the Weyl equation the Dirac equation for massless fermions are superposition of both "basic vectors" for particular \vec{p} , $|p^0| = |\vec{p}|$ $\hat{\mathbf{b}}^{s\dagger}(\vec{p}) = \alpha(\vec{p})\hat{b}_1^{\dagger} + \beta(\vec{p})\hat{b}_2^{\dagger}$.
- ▶ Let us introduce the corresponding creation operators also for the Dirac case on the same stage already, that is on the stage of "basic vectors".

We define for the Dirac case two new creation operators. a_i^{\dagger} and $\hat{\mathbf{a}}_i^{\dagger}$, (i=(1,2) representing spin (\uparrow,\downarrow) , respectively) as follows

$$\begin{split} \hat{b}_1^\dagger := & [+i] (+) & \text{to be related to} \quad \hat{\mathbf{a}}_1^\dagger := \begin{pmatrix} 1 \\ 0 \end{pmatrix} \cdot a_1^\dagger \,, \\ \hat{b}_2^\dagger := & (-i) [-] & \text{to be related to} \quad \hat{\mathbf{a}}_2^\dagger := \begin{pmatrix} 0 \\ 1 \end{pmatrix} \cdot a_2^\dagger \,, \end{split}$$

▶ The Hermitian conjugated partners are correspondingly

$$\hat{b}_1 := - ig[+i ig] ig(- ig)^{12}$$
 to be related to $\hat{\mathbf{a}}_1 := (1 \, 0) \cdot a_1$, $\hat{b}_2 := ig(+i ig) ig[- ig]^{12}$ to be related to $\hat{\mathbf{a}}_2 := (0 \, 1) \cdot a_2$,

Let us define the superposition of both creation operators $\hat{\mathbf{a}}_{i}^{\dagger}$, i=(1,2), which do not depend on momentum p^{a} , $\hat{\mathbf{a}}_{\vec{p}_{k}}^{s\dagger}:=\alpha_{1}^{s}(\vec{p}_{k})\,\hat{\mathbf{a}}_{1}^{\dagger}+\alpha_{2}^{s}(\vec{p}_{k})\,\hat{\mathbf{a}}_{2}^{\dagger}$ with coefficients $\alpha_{i}^{s}(\vec{p}_{k})$, i=(1,2),

chosen so that the superposition solves the equation of motion for a "plane wave" $e^{-i(p^0x^0-\vec{p}_k\cdot\vec{x})}$, where $|\vec{p_k}|=|p^0|$, determine

$$\hat{a}_{i}^{\dagger}(\vec{p}_{k})v_{i}^{s}(\vec{p}_{k})$$
 in the Dirac case.

The odd Clifford algebra offers the explanation for the Dirac's postulates for the second quantized fermions.

It explains:

- ► The appearance of the finite number of the internal degrees of freedom of fermions.
- ► The anticommutation relations among the creation and annihilation operators, creating the single fermion states.
- ► The infinite degrees of freedom of creation operators due to infinite dimensional ordinary space.
- The tensor products of Clifford odd creation operators explains the Hilbert space of the second quantized fermions.

to be related to

$$\psi^{s}(\vec{x}) = \int_{-\infty}^{+\infty} d^{3}p \, \hat{\mathbf{a}}^{s\dagger}_{\tilde{\mathbf{p}}} e^{-i(p^{0}x^{0} - \vec{p}_{k} \cdot \vec{x})}.$$

- ► It is worthwhile to notice that "nature could make a choice" of Grassmann rather than Clifford space:
 - o Also in Grassmann space, namely, one finds the anticommutation relations needed for a fermion field.
 - But in this case spinors would have spins and charges in adjoint representations with respect to particular subgroups.
 - o And no families would appear.

Vector gauge fields origin in gravity, in vielbeins and two kinds of the spin connection fields, the gauge fields of S^{ab} and \tilde{S}^{ab}

- ▶ All the vector gauge fields, A_m^{Ai} , (m,n) = (0,1,2,3) of the observed charges $\tau^{Ai} = \sum_{s,t} c^{Ai}_{st} S^{st}$, manifesting at the observable energies, have all the properties as assumed by the standard model.
- ▶ They carry with respect to the space index $m \in (0,1,2,3)$ the vector degrees of freedom, while they have additional internal degrees of freedom (τ^{Ai}) in the adjoint representations.
- ► They origin as spin conection gauge fields of S^{ab} : $A_m^{Ai} = \sum_{s,t} c^{Aist} \omega_{stm}$.
- ▶ S^{ab} applies on indexes (s, t, m) as follows

$$S^{ab} \omega_{stm...g} = i \left(\delta_s^a \omega^b_{tm...g} - \delta_s^b \omega^a_{tm...g} \right).$$

The action for vectors with respect to the space index m = (0, 1, 2, 3) origin in gravity

$$\int \mathbf{E} \, \mathbf{d}^4 \mathbf{x} \, \mathbf{d}^{(\mathbf{d}-\mathbf{4})} \mathbf{x} \, \alpha \, \mathbf{R}^{(\mathbf{d})} = \int \mathbf{d}^4 \mathbf{x} \, \{ -\frac{1}{4} \mathbf{F}^{\mathbf{A}i}{}_{\mathbf{mn}} \, \mathbf{F}^{\mathbf{A}i\mathbf{mn}} \},$$

$$\mathbf{A}^{\mathbf{A}i}{}_{\mathbf{m}} = \sum_{\mathbf{s},\mathbf{t}} \mathbf{c}^{\mathbf{A}i\mathbf{s}\mathbf{t}} \, \omega_{\mathbf{s}\mathbf{t}\mathbf{m}}.$$

Eur. Phys. J. C. 77 (2017) 231,

*

Also scalar fields (there are doublets and triplets) origin in gravity fields — they are spin connections and vielbeins — with the space index $s \geq 5$.

Eur. Phys. J. C. **77** (**2017**) 231, Phys. Rev. **D 91** (**2015**) 6, 065004, J. of Mod. Physics **6** (**2015**) 2244.

- ► There are several scalar gauge fields with the space index (s,t,s') = (7,8), all origin in the spin connection fields, either $\tilde{\omega}_{abs}$ or $\omega_{s'ts}$:
 - o Twice two triplets, the scalar gauge fields with the family quantum numbers $(\tilde{\tau}^{Ai} = \sum_{a,b} \tilde{c}^{Ai}{}_{ab} \tilde{S}^{ab})$ and o three singlets with the family members quantum numbers (Q,Q',Y'), the gauge fields of S^{st} .
- ► They are all doublets with respect to the space index (5,6,7,8).
- ► They have all the rest quantum numbers determined by the adjoint representations.
- ► They explain at the so far observable energies the Higgs's scalar and the Yukawa couplings.

The two doublets, determining the properties of the Higgs's scalar and the Yukawa couplings, are:

		state	τ^{13}	$\tau^{23} = Y$	spin	τ^4	Q
•	A ^{Ai} 78	$A_7^{Ai} + iA_8^{Ai}$	$+\frac{1}{2}$	$-\frac{1}{2}$	0	0	0
	A ^{Ai} 56 (-)	$A_5^{Ai}+iA_6^{Ai}$	$-\frac{1}{2}$	$-\frac{1}{2}$	0	0	-1
	A ^{Ai} 78	$A_7^{Ai} - iA_8^{Ai}$	$-\frac{1}{2}$	$+\frac{1}{2}$	0	0	0
	A ^{Ai} 56 (+)	$A_5^{Ai}-iA_6^{Ai}$	$+\frac{1}{2}$	$+\frac{1}{2}$	0	0	+1

There are $A_{78\atop 78\atop 78}^{Ai}$ and $A_{78\atop (+)}^{Ai}$ which gain nonzero vacuum expectation values at the electroweak break.

Index Ai determines the family $(\tilde{\tau}^{Ai})$ quantum numbers and the family members (Q,Q',Y') quantum numbers, both are in adjoint representations.

- ▶ There are besides doublets, with the space index s = (5, 6, 7, 8), as well triplets and anti-triplets, with respect to the space index s = (9, ..., 14).
- ► There are no additional scalars in the theory for d=(13+1).
- ► All are massless.
- ► All the scalars have the family and the family members quantum numbers in the **adjoint** representations.
- ▶ The properties of scalars are to be analyzed with respect to the generators of the corresponding subgroups, expressible with S^{ab} , as it is the case of the vector gauge fields.
- It is the (so far assumed) condensate, which makes those gauge fields, with which it interacts, massive.
 The condensate breaks the CP symmetry.

- ► The scalar condensate of two right handed neutrinos couple to
 - o all the scalar and vector gauge fields, making them massive,
 - o It does not interact with the weak charge $SU(2)_l$, the hyper charge U(1), and the colour SU(3) charge gauge fields, as well as the gravity, leaving them massless.
- J. of Mod.Phys.**4 (2013)** 823-847, J. of Mod.Phys. **6 (2015)** 2244-2247, Phys Rev.**D 91(2015)**6,065004.

Scalars with s=(7,8), which gain nonzero vacuum expectation values, break the weak and the hyper symmetry, while conserving the electromagnetic and colour charge:

$$\begin{array}{lll} \textbf{A}_s^{\text{Ai}} & \supset & \big(\,\textbf{A}_s^{\text{Q}}\,, \textbf{A}_s^{\text{Q}'}\,, \textbf{A}_s^{\text{Y}'}\,, \tilde{\tilde{\textbf{A}}}_s^{\tilde{1}}\,, \tilde{\tilde{\textbf{A}}}_s^{\tilde{N}_{\tilde{L}}}\,, \tilde{\tilde{\textbf{A}}}_s^{\tilde{2}}\,, \tilde{\tilde{\textbf{A}}}_s^{\tilde{N}_{\tilde{K}}}\,\big)\,, \\ \boldsymbol{\tau}^{\text{Ai}} & \supset & \big(\,\textbf{Q}, \quad \textbf{Q}', \quad \textbf{Y}', \quad \tilde{\tilde{\tau}}^1, \quad \tilde{\tilde{\textbf{N}}}_L, \quad \tilde{\tilde{\tau}}^2, \quad \tilde{\tilde{\textbf{N}}}_R\big)\,, \\ \textbf{s} & = & \big(\textbf{7}, \textbf{8}\big)\,. \end{array}$$

Ai denotes:

o family quantum numbers

- $(\tilde{ ilde{ au}}^1,\ \tilde{ ilde{ extbf{N}}}_{ extbf{L}})$ quantum numbers of the first group of four families and
- $(\tilde{\tilde{\tau}}^2, \tilde{\tilde{N}}_R))$ quantum numbers of the second group of four families.
- o And family members quantum numbers (Q, Q', Y')

A_s^{Ai} are expressible with either $\omega_{sts'}$ or $\tilde{\omega}_{abs'}$.

$$\begin{split} \vec{A}_{s}^{1} &= \left(\tilde{\omega}_{58s} - \tilde{\omega}_{67s}, \tilde{\omega}_{57s} + \tilde{\omega}_{68s}, \tilde{\omega}_{56s} - \tilde{\omega}_{78s} \right), \\ \vec{A}_{s}^{2} &= \left(\tilde{\omega}_{58s} + \tilde{\omega}_{67s}, \tilde{\omega}_{57s} - \tilde{\omega}_{68s}, \tilde{\omega}_{56s} + \tilde{\omega}_{78s} \right), \\ \vec{A}_{Ls}^{N} &= \left(\tilde{\omega}_{23s} + i \tilde{\omega}_{01s}, \tilde{\omega}_{31s} + i \tilde{\omega}_{02s}, \tilde{\omega}_{12}s + \tilde{\omega}_{03s} \right), \\ \vec{A}_{Rs}^{N} &= \left(\tilde{\omega}_{23s} - i \tilde{\omega}_{01s}, \tilde{\omega}_{31s} - i \tilde{\omega}_{02s}, \tilde{\omega}_{12}s - i \tilde{\omega}_{03s} \right), \\ A_{s}^{Q} &= \omega_{56s} - \left(\omega_{9\,10s} + \omega_{11\,12s} + \omega_{13\,14s} \right), \\ A_{s}^{Y} &= \left(\omega_{56s} + \omega_{78s} \right) - \left(\omega_{9\,10s} + \omega_{11\,12s} + \omega_{13\,14s} \right), \\ A_{s}^{4} &= - \left(\omega_{9\,10s} + \omega_{11\,12s} + \omega_{13\,14s} \right). \end{split}$$

The mass term, appearing in the starting action, is $(p_s,$ when treating the lowest energy solutions, is left out)

$$\mathcal{L}_{M} = \sum_{s=(7,8),Ai} \bar{\psi} \gamma^{s} (-\tau^{Ai} A_{s}^{Ai}) \psi = \\ -\bar{\psi} \left\{ (+) \tau^{Ai} (A_{7}^{Ai} - i A_{8}^{Ai}) + (-) \tau^{Ai} (A_{7}^{Ai} + i A_{8}^{Ai}) \right\} \psi ,$$

$$(\pm) = \frac{1}{2} (\gamma^{7} \pm i \gamma^{8}), \quad A_{78}^{Ai} := (A_{7}^{Ai} \mp i A_{8}^{Ai}).$$

Operators Y, Q and τ^{13} , applied on $(A_7^{Ai} \mp i A_8^{Ai})$

$$\tau^{13} (A_7^{Ai} \mp i A_8^{Ai}) = \pm \frac{1}{2} (A_7^{Ai} \mp i A_8^{Ai}),
\mathbf{Y} (A_7^{Ai} \mp i A_8^{Ai}) = \mp \frac{1}{2} (A_7^{Ai} \mp i A_8^{Ai}),
\mathbf{Q} (A_7^{Ai} \mp i A_8^{Ai}) = 0,$$

manifest that all $(A_7^{Ai} \mp i A_8^{Ai})$ have quantum numbers of the **Higgs's scalar of the standard model**, "dressing", after **gaining nonzero expectation values**, the right handed members of a family with appropriate charges, so that they gain charges of the left handed partners:

 $(A_7^{Ai} + iA_8^{Ai})$ "dresses" u_R, ν_R and $(A_7^{Ai} - iA_8^{Ai})$ "dresses" d_R, e_R , with quantum numbers of their left handed partners, just as required by the "standard model".

Ai measures:

either

o the Q,Q',Y' charges of the family members

or

o family charges $(\tilde{\tilde{\tau}}_{L}^{\tilde{1}}, \tilde{\tilde{N}}_{L})$, transforming a family member of one family into the same family member of another family,

manifesting in each group of four families the $\widetilde{SU}(2) \times \widetilde{SU}(2) \times U(1)$ symmetry.

** Eight families of u_R (spin 1/2, colour $(\frac{1}{2},\frac{1}{2\sqrt{3}})$) and of colourless ν_R (spin 1/2). All have "tilde spinor charge" $\tilde{\tau}^4=-\frac{1}{2}$, the weak charge $\tau^{13}=0$, $\tau^{23}=\frac{1}{2}$. Quarks have "spinor" q.no. $\tau^4=\frac{1}{6}$ and leptons $\tau^4=-\frac{1}{2}$. The first four families have $\tilde{\tau}^{23}=0$, $\tilde{N}_R^3=0$, the second four families have $\tilde{\tau}^{13}=0$, $\tilde{N}_L^3=0$.

	$\tilde{N}_R^3 = 0$, $\tilde{\tau}^{23} = 0$		$\tilde{N}_R^3 = 0$, $\tilde{\tau}^{23} = 0$	$\tilde{\tau}^{13}$	\tilde{N}_L^3

Before the electroweak break all the families are mass protected and correspondingly massless.

- Scalars with the weak and the hyper charge $(\mp \frac{1}{2}, \pm \frac{1}{2})$ determine masses of all the family members α of the lower four families, ν_R of the lower four families have nonzero $Y' := -\tau^4 + \tau^{23}$ and interact with the scalar field $(A_{(\pm)}^{Y'}, \vec{\tilde{A}}_{(\pm)}^{\tilde{I}}, \vec{\tilde{A}}_{(\pm)}^{\tilde{N}_L})$.
- ▶ The group of the lower four families manifest the $\widetilde{SU}(2)_{\widetilde{SO}(1,3)} \times \widetilde{SU}(2)_{\widetilde{SO}(4)} \times U(1)$ symmetry (also after all loop corrections).

$$\mathcal{M}^{m{lpha}} = egin{pmatrix} -a_1 - a & e & d & b \ e^* & -a_2 - a & b & d \ d^* & b^* & a_2 - a & e \ b^* & d^* & e^* & a_1 - a \end{pmatrix}^{m{lpha}} \; .$$

[arXiv:1412.5866], [arXiv:1902.02691], [arXiv:1902.10628]

We made calculations, treating quarks and leptons in equivalent way, as required by the "spin-charge-family" theory. Although

- ▶ any (n-1)x (n-1) submatrix of an unitary $n \times n$ matrix determines the $n \times n$ matrix for $n \ge 4$ uniquely,
- ▶ the measured mixing matrix elements of the 3 x 3 submatrix are not yet accurate enough even for quarks to predict the masses m4 of the fourth family members.
 o We can say, taking into account the data for the mixing matrices and masses, that m4 quark masses might be any in the interval (300 < m4 < 1000) GeV or even above. Other experiments require that m4 are above 1000 GeV.</p>
- ▶ Assuming masses m_4 we can predict mixing matrices.

Results are presented for two choices of $m_{u_4} = m_{d_4}$, [arxiv:1412.5866]:

- ▶ 1. $m_{u_4} = 700 \text{ GeV}$, $m_{d_4} = 700 \text{ GeV}$ new_1
- ightharpoonup 2. $m_{u_4} = 1\,200$ GeV, $m_{d_4} = 1\,200$ GeV..... new_2

One can see what

B. Belfatto, R. Beradze, Z. Berezhiani, required in [arXiv:1906.02714v1], that

$$V_{u_1d_4} > V_{u_1d_3}$$
, $V_{u_2d_4} < V_{u_1d_4}$, and $V_{u_3d_4} < V_{u_1d_4}$, what is just happening in my theory.

- ▶ o The matrix elements V_{CKM} depend strongly on the accuracy of the experimental 3 x 3 submatrix.
 - o Calculated 3 x 3 submatrix of 4 x 4 V_{CKM} depends on the m_{4th} family masses, but not much.
 - o $V_{u_id_4}$, $V_{d_iu_4}$ do not depend strongly on the m_{4th} family masses and are obviously very small.
- ► The higher are the fourth family members masses, the closer are the mass matrices to the democratic matrices for either quarks or leptons, as expected.
- ► The higher are the fourth family members masses, the better are conditions

$$V_{u_1d_4} > V_{u_1d_3}$$
 , $V_{u_2d_4} < V_{u_1d_4}$, and $V_{u_3d_4} < V_{u_1d_4}$ fulfilled.

- ► The stable family of the upper four families group is the candidate to form the Dark Matter.
- Masses of the upper four families are influenced :
 - o by the $SU(2)_{II\widetilde{SO}(3,1)} \times SU(2)_{II\widetilde{SO}(4)}$ scalar fields with the corresponding family quantum numbers,
 - o by the scalars $(A_{78}^Q, A_{78}^{Q'}, A_{78}^{Y'})$, and
 - o by the condensate of the two ν_R of the upper four families.

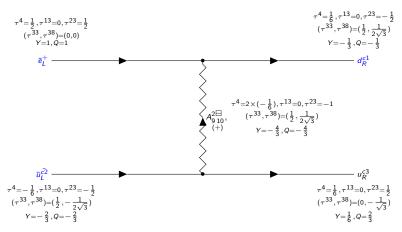

Matter-antimatter asymmetry

There are also triplet and anti-triplet scalars, s = (9, ..., d):,

		state	τ 33	τ^{38}	spin	τ^4	Q
	A _{9 10}	$A_9^{Ai}-iA_{10}^{Ai}$	$+\frac{1}{2}$	$\frac{1}{2\sqrt{3}}$	0	$-\frac{1}{3}$	$-\frac{1}{3}$
	A ^{Ai} 11 12	$A_{11}^{Ai}-iA_{12}^{Ai}$	$-\frac{1}{2}$	$\frac{1}{2\sqrt{3}}$	0	$-\frac{1}{3}$	$-\frac{1}{3}$
	A ^{Ai} 13 14 (+)	$A_{13}^{Ai}-iA_{14}^{Ai}$	0	$-\frac{1}{\sqrt{3}}$	0	$-\frac{1}{3}$	$-\frac{1}{3}$
	A _{9 10}	$A_9^{Ai} + iA_{10}^{Ai}$	$-\frac{1}{2}$	$-\frac{1}{2\sqrt{3}}$	0	$+\frac{1}{3}$	$+\frac{1}{3}$
	A _{11 12}	$A_{11}^{Ai}+iA_{12}^{Ai}$	$\frac{1}{2}$	$-\frac{1}{2\sqrt{3}}$	0	$+\frac{1}{3}$	$+\frac{1}{3}$
	A ^{Ai} 13 14 (-)	$A_{13}^{Ai}+iA_{14}^{Ai}$	0	$\frac{1}{\sqrt{3}}$	0	$+\frac{1}{3}$	$+\frac{1}{3}$

They cause transitions from anti-leptons into quarks and anti-quarks into quarks and back, transforming matter into antimatter and back. The condensate breaks CP symmetry, offering the explanation for the matter-antimatter asymmetry in the universe.

Let us look at scalar triplets, causing the birth of a proton from the left handed positron, antiquark and quark:

These two quarks, d_R^{c1} and u_R^{c3} can bind (at low enough energy) together with u_R^{c2} into the colour **chargeless baryon** - **a proton**.

After the appearance of the **condensate** the **CP** is **broken**.

In the expanding universe, fulfilling the Sakharov request for appropriate non-thermal equilibrium, these triplet scalars have a chance to explain the matter-antimatter asymmetry.

The opposite transition makes the proton decay.

These processes seems to explain the lepton number non conservation.

Dark matter

 $d \rightarrow (d-4) + (3+1)$ before (or at least at) the electroweak break.

- ► We follow the evolution of the universe, in particular the abundance of the fifth family members the candidates for the dark matter in the universe.
- ► We estimate the behaviour of our stable heavy family quarks and anti-quarks in the expanding universe by solving the system of Boltzmann equations.
- ► We follow the clustering of the fifth family quarks and antiquarks into the fifth family baryons through the colour phase transition.
- ► The mass of the fifth family members is determined from the today dark matter density.

Phys. Rev. D (2009) 80.083534

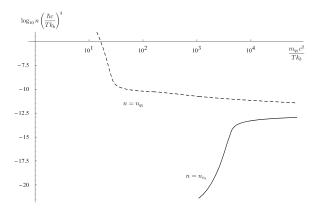

Figure: The dependence of the two number densities n_{q_5} (of the fifth family quarks) and n_{c_5} (of the fifth family clusters) as the function of $\frac{m_{q_5}c^2}{Tk_b}$ is presented for the values $m_{q_5}c^2=71~{\rm TeV}$, $\eta_{c_5}=\frac{1}{50}$ and $\eta_{(q\bar{q})_b}=1$. We take $g^*=91.5$.

We estimated from following the fifth family members in the expanding universe:

 \triangleright

$$10~{\rm TeV} < m_{q_5}\,c^2 < 4 \cdot 10^2 {\rm TeV} \,.$$

Þ

$$10^{-8} {
m fm}^2 < \sigma_{c_5} < 10^{-6} {
m fm}^2$$
 .

(It is at least $10^{-6}\times$ smaller than the cross section for the first family neutrons.)

We estimate from the scattering of the fifth family members on the ordinary matter on our Earth, on the direct measurements - DAMA, CDMS,..- ...

$$200\,{\rm TeV} < m_{q_5}c^2 < 10^5\,{\rm TeV} \,.$$

- ► In the standard model the family members with all their properties, the families, the gauge vector fields, the scalar Higgs, the Yukawa couplings, exist by the assumption.
- ** In the spin-charge-family theory the appearance and all the properties of all these fields follow from the simple starting action with two kinds of spins and with the gravity only.
 - ** The theory offers the explanation for the dark matter.
 - ** The theory offers the explanation for the matter-antimatter asymmetry.
 - ** All the scalar and all the vector gauge fields are directly or indirectly observable.
- ► ** The spin-charge-family theory even offers the creation and annihilation operators without postulation.

The *spin-charge-family* **theory** explains also many other properties, which are not explainable in the *standard model*, like "miraculous" non-anomalous triangle Feynman diagrams.

The more work is put into the *spin-charge-family* theory the more explanations for the phenomena follow.

Concrete predictions:

- ► There are several scalar fields; o two triplets, o three singlets, explaining higgss and Yukawa couplings, some of them will be observed at the LHC, JMP 6 (2015) 2244,
 - **Phys. Rev. D 91 (2015)** 6, 065004.
- ► There is the fourth family, (weakly) coupled to the observed three, which will be observed at the LHC, New J. of Phys. 10 (2008) 093002.
- ► There is the dark matter with the predicted properties, Phys. Rev. D (2009) 80.083534.
- ► There is the ordinary matter/antimatter asymmetry explained and the proton decay predicted and explained, Phys. Rev. D 91 (2015) 6, 065004.

We recognize that:

- ► The last data for mixing matrix of quarks are in better agreement with our prediction for the 3 × 3 submatrix elements of the 4 × 4 mixing matrix than the previous ones.
- ➤ Our fit to the last data predicts how will the 3 × 3 submatrix elements change in the next more accurate measurements.
- ► Masses of the fourth family lie much above the known three, masses of quarks are close to each other.
- ▶ The1larger are masses of the fourth family the larger are $V_{u_1d_4}$ in comparison with $V_{u_1d_3}$ and the more is valid that $V_{u_2d_4} < V_{u_1d_4}$, $V_{u_3d_4} < V_{u_1d_4}$.

 The flavour changing neutral currents are correspondingly

The flavour changing neutral currents are correspondingly weaker.

- ► Masses of the fifth family lie much above the known three and the predicted fourth family masses.
- ▶ Although the upper four families carry the weak (of two kinds) and the colour charge, these group of four families are completely decoupled from the lower four families up to the $<10^{16}$ GeV, unless the breaks of symmetries recover.
- Baryons of the fifth family are heavy, forming small enough clusters with small enough scattering amplitude among themselves and with the ordinary matter to be the candidate for the dark matter.
- ► The "nuclear" force among them is different from the force among ordinary nucleons.

- ► The spin-charge-family theory is offering an explanation for the hierarchy problem:
 - The mass matrices of the two four families groups are almost democratic, causing spreading of the fermion masses from 10^{16} GeV to 10^{-8} MeV.

To summarize:

- ▶ I hope that I managed to convince you that I can answer many open questions of particle physics and cosmology.
- ► The collaborators are very welcome!
- ▶ There are namely a lot of properties to derive.
